I am the first time to contact with html and css similar programming, for these things, I do not know anything, when I first contact html, I do not even know what to do, I do not know the first step should be what. But for me, programming was an unknown territory that I had never explored, and I was even a little curious about what it was all about. Is it just for making websites？ I started the web page production with questions, in my production process, I think programming is not a very easy thing, even a little difficult, for me, it is a mental work.
